RoHS compliant
10G XFP CWDM Transceiver
XFP CWDM 80KM Optical Transceivers
Duplex LC,1470~1610nm, CWDM, EML, APD Receiver, Single Mode, 80km

Features

- Support multi protocol from 9.95Gb/s to 11.3Gb/s
- Hot pluggable 30 pin connector
- Compliant with XFP MSA
- Transmission distance of 80km over single mode fiber
- CWDM EML laser transmitter.
- APD Receiver
- Duplex LC connector
- 2-wire interface for management and diagnostic monitor
- XFI electrical interface with AC coupling
- Power supply voltages : +3.3V, +5V
- Temperature range: -5°C to 70°C/-30°C to 70°C/-5°C to 85°C
- Power dissipation: <3.5W
- RoHS Compliant Pa

Applications

- CWDM Networks
- OC-192/STM-64 with FEC
- SONET OC-192/SDH STM-64
- 10GBASE-ZR/ZW Ethernet
- 80km 10G Fiber Channel

Description:

Carelink' CL_XFP_C80-XX Small Form Factor 10Gb/s (XFP) transceivers are compliant with the current XFP Multi-Source Agreement (MSA) Specification. The high performance cooled CWDM EML transmitter and high sensitivity APD receiver provide superior performance for SONET/SDH and Ethernet applications up to 80km optical links.

is not required .

Digital Diagnostic Functions:

As defined by the XFP MSA 1 , Carelink's XFP transceivers provide digital diagnostic functions via a 2-wire serial interface, which allows real-time access to the following operating parameters:

✓ Transceiver temperature
✓ Laser bias current
✓ Transmitted optical power
✓ Received optical power
✓ Transceiver supply voltage

It also provides a sophisticated system of alarm and warning flags, which may be used to alert end-users when particular operating parameters are outside of a factory-set normal range.

The operating and diagnostics information is monitored and reported by a Digital Diagnostics Transceiver Controller (DDTC) inside the transceiver, which is accessed through the 2-wire serial interface. When the serial protocol is activated, the serial clock signal (SCL pin) is generated by the host. The positive edge clocks data into the XFP transceiver into those segments of its memory map that are not write-protected. The negative edge clocks data from the XFP transceiver. The serial data signal (SDA pin) is bi-directional for serial data transfer. The host uses SDA in conjunction with SCL to mark the start and end of serial protocol activation. The memories are organized as a series of 8-bit data words that can be addressed individually or sequentially. The 2-wire serial interface provides sequential or random access to the 8 bit parameters, addressed from 000h to the maximum address of the memory.
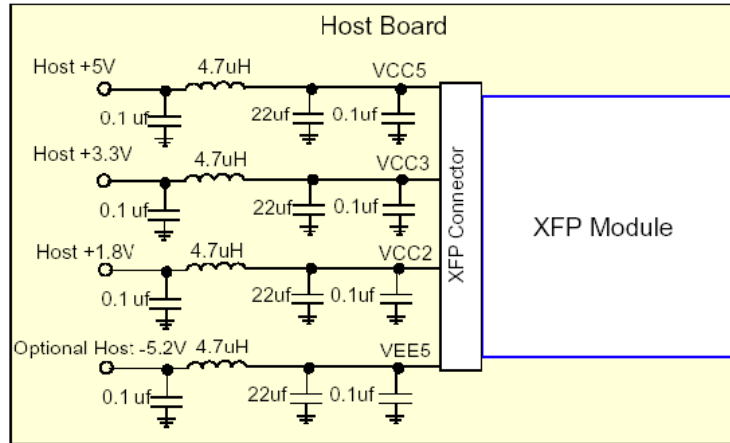

For more detailed information including memory map definitions, please see the XFP MSA Specification.
